                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ଚ
/note="EGF; Region: EGF-like domain. There is no clear separation between noise and signal. pfam00053 is very similar, but has 8 instead of 6 conserved cysteines. Includes some cytokine receptors. The EGF domain misses the N-terminus regions of the Ca2+ binding EGF domains. The family is hard to model due to many similar but different sub-types of EGF domains. Pfam certainly misses a number of EGF domains. Pfam certainly misses a number of EGF domains.

/ note: "SGC CA, Region: Calcium-binding EGF-like domain, present in a large number of membrane-bound and extracellular (mostly animal) proteins. Many of these proteins require calcium for their biological function and calcium-binding sites have been found to be located at the N-terminus of particular EGF-like domains."

organial source text: Human liver, cDNA (library of Woo) to mRNA, clones lambda-HC1026 and lambda-HC1375.

clones lambda-HC1026 and lambda-HC1375.

clones lambda-HC1026 and lambda-HC1375.

protein C is a precursor to a serine protease called 'activated protein C that has a strong anticoagulant activity. The amino acid sequence as determined from the cDNA indicates that protein C is synthesized as a single-chain polypeptide containing the light chain and the heavy chain connected by a dipeptide of Lys-Arg. This precursor peptide is then connected to the light and heavy chains by cleavage of two or more internal peptide bonds. The amino acid sequence of thuman protein C shows a high homology with that of the bovine molecule. Two clones were sequenced in [1] and shown to code for human protein C. Clone lambda-HC1026 covers by 146-1140, and clone lambda-HC1375 covers by 1-1366. The two cDNA clones had a poly-A tail at different positions; both poly-A sites were location (Jualifiers)
